```
The specification describes a beta-secretase enzyme. The enzyme cleaves beta-amyloid precursor protein to produce beta-amyloid peptide. This enzyme is therefore implicated in the production of amyloid plaque components which accumulate in the brains of individuals afflicted with Alzhaimer's disease. Inhibitors of beta-secretase are administered to a mammalian subject e.g. with Alzhaimer's disease or Alzheimer's diseaserike plaque burden. The compounds are used for the treatment of amyloidogenic diseases e.g. Alzhaimer's disease. represents an inhibitor of beta-secretase enzyme.
                                                                                                                                                                                  Purified beta-secretase protein used in assays to discover inhibitors which can be used for the treatment of amyloidogenic diseases e.g. Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Beta-secretase; beta-amyloid precursor protein; beta-amyloid peptide;

                                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes a beta-secretase enzyme. The enzyme cleaves beta-amyloid precursor protein to produce beta-amyloid peptide. This enzyme is therefore implicated in the production of amyloid plaque components which accumulate in the brains of individuals afflicted with Alzheimer's disease. Inhibitors of beta-secretase are administered to a mammalian subject e.g. with Alzheimer's disease or Alzheimer's disease. Is they maintain or improve cognitive ability or reduce the plaque burden. The compounds are used for the treatment of amyloidogenic diseases e.g. Alzheimer's disease. The present sequence represents an inhibitor of beta-secretase enzyme
                                                                                                                                                                                                                                                                                                      Purified beta-secretase protein used in assays to discover inhibitors which can be used for the treatment of amyloidogenic diseases e.g. Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            taste transduction; G-protein coupled receptor; T2R; taste signaling; cAMP level; cGMP level; IP3 level; Ca(2+) level; electrical activity; human; G-protein coupled receptor; receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention describes an isolated taste transduction G-protein coupled receptor (1) e.g., T2R which is expressed in a taste cell, comprises greater than 60% sequence identity to a fully defined sequence of 315 (S1), 313 (S2), 299 (S1), 310 (S4), 214 (S5), 77 (S6), 209 (S7), 266 (S8), 300 (S9), 300 (S10), 155 (S11), 173 (S12), 94 (S13), 115 (S14), 68 (S15), 316 (S16) and 180 (S17) amino acids as given in the specification. (I) is useful for identifying a compound that modulates taste signaling in taste cells which involves contacting the compound (I). The functional effect is determined by measuring changes in intracellular cAMP, CGMP, 197, or Ca (2+). The functional effect is a chemical or physical effect. Fig. (S12), 510 (S1

The invention relates to new Proteus mirabilis polypeptides and polymerleotides. The invention also relates to antibodies against the polypeptides, amethod of generating vaccines for producing the polypeptides, amethod of polypeptides and amethod of polypeptide and a method for screening test compounds for mirabilis, a polypeptide and a method for screening test compounds for antibation activity. The polypeptides and polymerleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial dayage or as bio-control agents for plants. This sequence represents a Proteus mirabilis polypeptide of the invention.
                                                                                        New Proteus mirabilis polypeptides and polynucleotides, useful reagents for diagnosis of bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or biocontrol agents for plants.

organism particularly analysis, applicable in genome of c Method for disrupting targeted gene in thermostable bacterium and with genome studying gene structure and functions.

Claim 9; SEQ ID NO 216; 598pp; Japanese.

This invention relates to a novel method for targeting disruption of an

whole sequential data of the genome of such organism, selecting at least larbitrary region in the sequence, providing a vector that contains a sequence homologous with the selected region and a marker gene, transformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly thermococcus kodakaraenais KODI. The method is for targeting the disruption of a gene in the genome of an organism, which is applicable in scudying gene structure and functions as well as enzyme activities of encoded proteins and useful in medicine, forensic science, food or drug inspection, molecular biology and immunology, with this method, the disruption of a gene at an arbitrary position in a genome can be achieved efficiently and reliably. The present sequence is that of a protein concoded by the genome of Thermococcus kodakaraensis which was derived using the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format diarectly from WIPO at arbitrary gene in a genome of an organism which comprises providing the ftp.wipo.int/pub/published_pct_sequences

Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms

Claim 5; SEQ ID NO 2285; 261pp + Sequence Listing; English

The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as

ö
strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire wipo int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid; a vector comprising a promoter operably linked by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zyskind JW;

Method for disrupting targeted gene in genome of organism particularly thermostable bacterium and with genome chips for analysis, applicable in studying gene structure and functions. Claim 9; SEQ ID NO 1428; 598pp; Japanese. This invention relates to a novel method for targeting disruption of an arbitrary gene in a genome of an organism which comprises providing the whole sequential data of the genome of such organism, selecting at least

ransformation, and homologous with the selected region and a marker gene, transformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly Thermococcus kodakaraensis KODI. The method is for targeting the disruption of a gene in the genome of an organism, which is applicable in studying gene structure and functions as well as enzyme activities of canced proteins and useful in medicine, forensic science, food or drug inspection, molecular biology and immunology. With this method, the disruption of a gene at an arbitrary position in a genome can be achieved efficiently and reliably. The present sequence is that of a protein encoded by the genome of Thermococcus kodakaraensis which was derived using the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained the wipo.int/pub/published_pot_sequences ö Porphorymonas gingivalis; PG; periodontal disease; gingivitis; vaccine; a vector that contains a Margetts MB; Antigenic Porphorymonas gingivalis peptides for preventing gingivitis.             AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAX94583. AAX91802 to AAX91899 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used to detect Porphorymonas gingivalis. Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivalis. (Updated on 20-MAR-2003 to correct PR field.)

The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Enterococcus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
AAY34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid comprising a sequence encoding an Enterococcus fecalis polypeptide, useful for preparing a composition for diagnosing or treating E. fecalis infection.

the invention fracters to an instruct acts compitating any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a promoter operably linked to the nucleic acid encoding a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway confideration; (7) identifying a compound that influences the biological pathway in which a proliferation or the biological pathway is agene required for cellular proliferation or the biological pathway in which a proliferation for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent compound; activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent compound; activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the cardiac acids are useful for dentifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational cauged in culture of a compound. Strains in the confidention of an organism, or for screening caudidate molecules for rational cauged in confidention in cells other than S. aureus, S. typhimurium,

This invention relates to a novel method for targeting disruption of an arbitrary gene in a genome of an organism which comprises providing the whole sequential data of the genome of such organism, selecting at least a restrict and data of the sequence, providing a vector that contains a sequence homologous with the selected region and a marker gene, cransformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly the genome of a hyperthermostable archaebacterium, particularly the genome of a proteins which is applicable in the genome of a gene in the genome of an organism, which is applicable in crucytion of a gene in the genome of an organism, which is applicable in crucytion of a gene at an arbitrary position in a genome can be achieved disruption of a gene at an arbitrary position in a genome can be achieved efficiently and reliably. The present sequence is that of a protein crucange the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained the wipo int/pub/published_pot_sequences
                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises beta-secretase inhibitory peptides. The beta-secretase inhibitory peptides of the invention are useful for the prevention or treatment of neurodegenerative diseases, such as:
Alzheimer's disease, Parkinson's disease, neuropathy, postencephalitis, cerebral palsy, and memory loss. The beta-secretase inhibitory peptides of the invention are also useful in the manufacture of an sAPPR secretion promoter or neurotropic factor-like agent. The present amino acid sequence represents a beta-secretase inhibitory peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                            /note= "(2R, 3S)-3-amino-2-hydroxy-4-phenylbutanoic acid"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel compound such as beta-secretase inhibitor, useful as preventive or therapeutic agent for treating neurodegenerative disease such as Alzheimer's disease, Parkinson's disease and neuropathy.
                                                                                                                                                                                                                                                                                       beta-secretase inhibitory peptide; neurodegenerative disease;
Alzheimer's disease; Parkinson's disease; neuropathy; postencephalitis;

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27525 encode the human ORFX proteins given in ABP00101 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a cyndrome associated with ORFX-associated disorder. ORFX polymucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders allitus, systemic transplantation, cardiovascular diseases, diabetes mellitus, systemic corpus systhematosus, hypertension, hypothyroidism, cholesterol ester corpus storage diseases, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host conservative conservative diseases. On the conservative diseases of the conservative diseases of the conservative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful for treating burns, inclisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from restemic cytokine damage. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies polypeptides may be used as antigens in the production of antibodies contacting the compactic agents for determining P. acnes polypeptides and determining P. acnes polypeptides may also be used as therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by contame linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed appecification, but was
                                                                                                                                                                                                                                                                                          SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uvaitis; endopthalnitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; engryme linked immunosorbent assay; dermatological; osteopathic; neuroprotectent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bhatia A;
                                                                                                                                                                                                                                                       Propionibacterium acnes immunogenic protein #17674.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mitcham JL, Wang SS,

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (BMB35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a polymeptide of the invention; an proteins comprising a polypeptide of the invention; an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared to polymeleotides, a vaccine composition (comprising P acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit confident; and a method for inhibiting the development of P. acnes in a patient; The P. acnes polypeptides, polymeleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polymeptides are useful for diagnosing, preventing or treating acne protein. The polymulations or antigen-presenting cells that express the polymeptides are useful for diagnosing, preventing or treating acne protein. The polymulations or antigen-presenting cells that express the protein. The polymulations and also be used as probes or primers for uncleic acid hybridistation. The vaccine composition is useful for the esquence represents a polypeptide predicted to be encoded by an ORF (open ceducing frame) contained within the P. acnes polymucleotides of the cinvention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly the printed specification, but an immune the polyment of the printed specification, but an immune the polyment of the printed specification, but an immune the polyment of the printed specification, but an immune the polyment of the printed specification, but an immune the pol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Maisonneuve JL;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a secretory polynucleotide (designated sptm) comprising any of 567 polynucleotide sequences (AB235837-AB236403), a naturally occurring polynucleotide sequence at least 90 % identical to the polynucleotide complementary to them or an RNA equivalent of them. The polynucleotide complementary to them or an RNA equivalent of them. The polypeptide or polynucleotide are useful for treating, preventing or diagnoshing a disease or condition associated with the expression of functional SPTM. These are particularly useful for diagnoshing, treating or preventing autoimmune/inflammatory disorders (e.g. acquired immunodeficiency syndrome, anaemia, asthma or Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; SPTM, autoimmune disorder; inflammatory disorder; AIDS; anaemia; asthma; Crohn's disease; neurological disorder; epilepsy; cancer; Huntington's disease; halzheimer's disease; Creutzfeldt-Jakob disease; multiple sclerosis; Parkinson's disease; cell proliferative disorder; anti-inflammatory; immunosuppressive; neuroprotective; nootropic; anticonvulsant; cytostatic; antiparkinsonian; anxiolytic; antipportatic; antianaemic; anti-HVV; human immunodeficiency virus; secretory polynucleotide; secretory protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human secretory proteins and polynucleotides, useful for diagnosing, treating or preventing autoimmune/inflammatory disorders (e.g. AIDS), neurological disorders (e.g. Alzheimer's), or cell proliferations or

                                                 system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzeimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolypic activity, chemotactic/chemokinetic activity, haemostatic as the and thrombolypic activity, ancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

                                                                     The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system diseases, such as parkinson's disease, injuries, peripheral nervous system disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, activities and inflammation, leukaemias and State and Control activity, atthritis and inflammation, leukaemias and control activity, atthritis and inflammation, leukaemias and control activity, atthritis and inflammation, leukaemias and control activity, activity a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ren F, Wang D;

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytoatatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous is system, such as peripheral nervous injuries, peripheral nervous contained nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic laterial selectorsis, and Shy-Drager Syndrome. Other uses include the cutilisation of the activities such as: Immune system suppression, activity, chemotextic/chemokinetic activity, chemotextic/chemokinetic activity, hammostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
Novel nucleic acids and polypeptides, useful for treating disorders such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This invention relates to a three dimensional structure of Thermus thermophilus 70S ribosome resolved using x-ray crystallography up to 5.5

Disclosure; Page 502; 525pp; English.

Novel three dimensional structure of Thermus thermophilus 70S ribosome resolved using x-ray crystallography upto 5.5 Angstroms resolution, useful for screening and designing compounds that alter ribosome

```
ö
Angstrom resolution. The invention also discloses a method for identifying a compound that binds to a bacterial 70S ribosome or its portion. The method comprises designing a compound based upon a three-dimensional structure of the bacterial 70S ribosome, where the structure co-ordinates are given in the specification, contacting the compound with the bacterial 70S ribosome or its portion and determining whether the compound binds to the bacterial 70S ribosome or its portion. The 70S ribosome is sites on the new or its portion. The 70S ribosome is sites on the 70S ribosome and design compounds that bind to sites on the 70S ribosome and that alter the ribosome function. The present sequence represents a ribosomal protein sequence used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(11 a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated applypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid comprising any one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zyskind JW;

WPI; 2003-029926/02. N-PSDB; ACA27849 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 51903; 1766pp; English.

the inventor relates to an insolated muchalc acid compilating any one or the inventor relates to an insolated muchalc acid inhibits proliferation of a cell. Also included are:

Co the nucleic acid inhibits proliferation of a cell. Also included are:

Co of the nucleic acid inhibits proliferation of a cell. Also included are:

Co encoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide, (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway or the proliferation, or that inhibits cellular proliferation; (8) dentifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture compusing strains in which the each of the strains is present in a culture or collection of compound's activity; (11) a culture compising strains in which the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense mucleic acids are useful for dentifying proteins or screening for homologous mucleic acids required for cellular proliferation of an organism. The antisense mucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for cellular proliferation of solate candidate molecules for rational ö drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent din not form part of the printed specification, but was obtained in electronic format directly from NIPO at from the proposition of the printed specification. Gaps 82.8%; 57.1%; Query Match Best Local Similarity 57.1%, Best Local Similarity 4; Conservative Sequence 195 AA;

                                                                                                                                                                     promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgenic plant seed which has in its genome the construct, that is functional in the plant to transcribe the oil-associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing vegetable oil. The present sequence represents the amino acid sequence of an oil-associated gene related protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel isolated Streptococcus pneumoniae polynucleotides (see AAZ96173-Z96494) and their encoded proteins (see AAX961792.Y86182). The DNA, vectors and host cells described in the method of the invention are useful for the recombinant expression of the polypeptides. The polypeptides are useful for treatment or prevention of disease, or diagnosis of disease related to expression or activity of

The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies
such a polypeptide. They can also be used to screen for compounds which interact with and inhibit or activate such a polypeptide. The polypeptides (or DNA encoding them, via gene therapy) are also useful for inducing an immunological response in a mammal. The antagonists are useful to inhibit such bacterial polypeptides. The polypeptides are particularly useful to identify antimicrobial compounds and antibiotics. They are also useful to determine their role in pathogenesis of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              encoding a Propionibaccerium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (ARM35624-ARM64536) and to additionally encompassof P. acnes polypeptides. The invention additionally encompasson vectors and host cells comprising a polymucleotide of the invention; antibodies against polypeptides of the invention; fusion proteins comprising a polypeptide of the invention; an importance specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention relates to an isolated polynucleotide (ACF64435-ACF64733)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Maisonneuve JL;

ö
proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acnewulgaris, or for stimulating an immune response specific for a P. acnes protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated appropptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense; prokaryotic essential gene; cell proliferation; drug design.

proliferation or the activity of a gene in an operon required for the proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains in collidar inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proceins or screening for homologous nucleic acids required for interface and a proliferation of a compound that inhibits for identifying proceins or screening for homologous nucleic acids required for interface and processed or the indicate molecules for retional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vaccine, eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; includaton conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food is sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations
vaccines against Chlamydia trachomatis. Antisense and ribozyme sequent can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, peritypeptitis, bartholinitis; pneumopathy in breast feeding infants; wenereal lymphogranulomatosis. The polypeptides of the invention may be use in treating these diseases
                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.
                                                                                                                                                                                                                                                                       .;

A crystal (II) comparising a binding pocket of an RTK that regulates the kinase domain of the RTK, or comprising a juxtamembrane region and/or kinase domain of an RTK or its part, or formed by a juxtamembrane region and a RTK in an autoinhibited state and a model (III) of (I) made using (I); are useful for determining the secondary and/or tertiary structure of a polypeptide, or for screening for a ligand capable of binding to a binding pocket and/or inhibiting or enhancing the atomic contacts of interactions in a binding pocket. (I) is useful for identifying a modulator of an RTK. (II) is useful for designing, modelling, identifying, evaluating and/or synthesizing mimetics of a
responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated binding pocket of receptor tyrosine kinase that regulates the kinase domain of the receptor, useful for identifying modulator of the receptor for treating lymphoproliferative conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Receptor tyrosine kinase; RTK; kinase domain; cytostatic; antiarthritic; antiinflammatory; immunosuppressive; antirheumatic; virucide; noctropic; neuroprotective; cerebroprotective; antiparkinsonian; dermatological; nephrotropic; tranquilizer; vulnerary; anticonvulsant; VAB-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "residues Xaa are not clearly indicated in the specification"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
       make a model for (1) or its complexes or parts, in First procest, to make a model for (1) or its complexes or parts, in First orpystallography techniques, or for determining three-dimensional structures of polypeptides with unknown structures. Pharmaceutical compositions comprising the ligand or modulator is useful for tracting lymphoproliferative conditions, malignant and pre-malignant conditions lymphoproliferative conditions, malignant and pre-malignant conditions lupus erythematosus, immune-related glomerulonephritis, rheumatoid arthritis), viral infection, inflammation, graft versus host disease, neurodegenerative diseases and conditions involving trauma and injury to Huntington's disease and multiple sclerosis). The present sequence represents a VAB-1 protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Carr GJ;

useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acids sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Masignani V, Tettelin H, Fraser C;

WPI; 2003-040579/03. N-PSDB; ABX06581 New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or infection

Claim 1; SEQ ID NO 1738; S6pp; English.

The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56494. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a

cc sequence not defined in the specification, for amplifying a target sequence contained within a Streptococcus nucleic acid sequence, where the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence to the target sequence and the second primer is substantially complementary to the complement of the target sequence to substantial complementarity define the terminio of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes concoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying immunodominant proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pot_sequences. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8)
variant of the polynucleotide or a nucleic acid sequence 95% identical to one of the polynucleotides. The S. pneumoniae polynucleotides and encoded polypeptides (ABPB1299-ABPB1674) are useful for treating or preventing S. pneumoniae infections or non-systemic diseases, e.g. otitis media, which are induced or exacerbated by S. pneumoniae. These are also useful for pneumoniae in a biological sample or diagnosing S. pneumoniae in a biological sample or diagnosing S. pneumoniae infection in a subject. The polynucleotides have antibacterial activity and are useful in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense; prokaryotic essential gene; cell proliferation; drug design.

pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent product is overexpressed or underexpressed; (12) determining the extent or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, C. T. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Mote: The sequence data for this ferred in collection, but was obtained the collection of form part of the printed specification, but was obtained the collection of the collection of the printed specification, but was obtained the collection of th

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated Streptococcus pneumoniae nucleic acids and polypeptides. The nucleic acids and proteins are useful for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, such as S. pneumoniae infection. These may also be used for drug screening procedures. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecules and polypeptides useful for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, e.g. Streptococcus pneumoniae infection, and in drug

the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense continued acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense contisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular contisense or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that has an activity against a biological pathway continued for proliferation or the biological pathway in which a proliferation or that inhibits proliferation of an organism acts; (9) manufacturing an antibicit; (10) profiling a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibicit; (10) profiling the extent compound activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or product is overexpressed or underexpressed; (12) determining the extent of strains; or (13) identifying the target of a compound that inhibits the conjusting proteins or screening for homologous nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for the proversor proverse or andidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification of the printed from wipo int/pub/published_pct_sequences
The invention relates to an isolated nucleic acid comprising any one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

                                                                                                                                                                               ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynuclectides are useful in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system, such as peripheral nervous system, such as and central nervous systems, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic utilisation of the activities such as: Immune system suppression, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, cancer disgnosis and therapy, drug screening, and thrombolytic activity, cancer disgnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ě,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human nucleic acids (AAIS7798-AAI61369) and the

Claim 1; Page 89-90; 136pp; English.

The present sequence is a membrane transport protein, MTRP-1 from Incyte clone 961344 isolated from human BRSTTUT03 cDNA library. MTRP-1 shows homology to the mouse BI-E2 ATPase and is expressed in reproductive, nervous and haematopoietic/immune tissues. The present sequence is useful in diagnosis, prevention and treatment of disorders related with increased or decreased expression of MTRP such as familial goitre, Menkes disease, diabetes, Parkinson's disease, neurological disorders such as Alzheimer's disease, depression, epilepsy, schizophrenia, immune/inflammatory disorders such as AlDS, Addison's disease, allergies, atherosclerosis, Graves disease, gout, Hashimoto's thyroiditis, viral,

```
ö
bacterial, fungal, parasitic, protozoal or helminthic infections and cell proliferative disorders such as cancer. Fragments of MTRP polymucleotides are useful as targets in microarrays. MTRP DNA is useful for generating hybridisation probes useful in mapping genomic sequences and detecting differences in sequences among normal, carrier and affected individuals. It is also used for screening libraries of compounds in drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM3213) with noorropic, fimunosuppressant and cyrostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ą,

ö
in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous thy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral seclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid encoding an insect gustatory receptor (Gr) or odorant receptor (Or) protein which comprises seven transmembrane domains and a C-terminal domain comprising consecutive amino acids. The invention is useful for identifying a compound which activates the insect receptor or inhibits the activity of the insect receptor or inhibits the activity of a lipid bilayer. The purified insect receptor protein is embedded in a lipid bilayer. The invention is sprayed for combating ingestion of crops by pest insects, combating disease-carrying insects in an area and controlling a pest population in an area. The invention is useful for detecting the presence of insect gustatory or odorant receptor and for inhibiting the function of the receptor in humans or animals or in biological fluids isolated from them. The invention is also useful for identifying or isolating other insect receptors and for combating pest
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acid encoding insect gustatory or odorant receptor protein useful for identifying a compound which specifically binds to the receptor for controlling a pest population in an area.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fruit fly; gustatory receptor; Gr; odorant receptor; Or; pesticide;

 RESULT 53
```

```
This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to convacious and the encoded proteins thereof. Specifically, it refers to convacious desired by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as attribodies, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the CDNA molecules. As such, these concludate expression of the CDNA molecules. As such, these concludate expression of the CDNA molecules are useful in gene therapy for treating osteoporosis, neurological disease, Albahamer's disease, Parkinson's disease, dementia, short memory and various cancers, as well as for maintaining equilibrium of sense or motor function, and for treating emotional reaction, fear response and panic. Accordingly, they exhibit osteopathic, neuroprotective, noctropic, antiparkinsonian, encoded by a full length human cDNA sequence of the invention. NOTE: This sequence is not given in the sequence listens of the invention but
                                                                                                                                                                                                                                                                                                                                                           New 1995 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers.

the 6113 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid;

(2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that inhibits cellular proliferation; (8) identifying a gene required for that has an activity against a biological pathway required for proliferation or the biological pathway in which a proliferation required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for
                                                                                                                                                                                                      New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. arreus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                   invention relates to an isolated nucleic acid comprising any one of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF66431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade. Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleotide sequences isolated from Pyrococcus abyssi encode proteins useful in industry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA aequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zyskind JW;

the invention fraidres to an instance and compilating any one of the nucleic acid inhibits proliferation of a cell. Also included are:

the folls antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

the folls are proportion of the more comprising a promoter operably linked to the nucleic acid concoding a polypeptide whose expression is inhibited by the antisense continued antisense continued to antisense nucleic acid; (1) a nost cell containing the vector; (1) an isolated continued to polypeptide; (2) producing the polypeptide; (6) inhibiting cellular continued for the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for required for that has an activity against a biological pathway continued for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound, activity; (1) manufacturing an antibicit; (10) profiling a compound, activity; (11) a culture comprising strains in which the extent compound, activity; (11) a culture comprising strains in which the extent compound, activity; (11) a culture comprising strains in which the compound is conference or collection of an organism. The antisense nucleic acids are useful for cidentifying proteins or screening for homologous nucleic acids required for for ellular proliferation of an organism. The autisense mulled codes are useful for dentifying proteins or screening for homologous nucleic acids required for confidence or or for granism acrossing acids are useful for dentifying proteins or for granism candidate molecules for rational and account and account of an organism.
                                                                                                                                                                                                                                                                      or screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                     New antisense nucleic acids, useful for identifying proteins or scre
for homologous nucleic acids required for cellular proliferation to
isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid comprising any

```
the 613 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or that an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a compound that inhibits proliferation of an cequired for proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which a proliferation required gene or its gene product lies or a gene on which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The attriense mucleic acids required for cellular proliferation of an organism. The attriense uncleic acids required for cellular proliferation of an organism or the candidate molecules for rational additional accidence or cellular proliferation of the condition or an organism. The attriense mucleic acids required for a second or the candidate molecules for rational
                                                                                                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid comprising any one of

Bacterial polypeptide #5367.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant comprising the recombinant DNA construct and growing a plant second plant with the method of producing a transformed plant to avoid an improved property comprises transformed plant with the tercombinant DNA construct and growing the transformed plant where the compinant DNA construct and growing the transformed plant with the polynucleotide or polypeptide is useful for improving plants with the polynucleotide or polypeptide is useful for producing plants with the recombinant DNA construct is useful for producing plants with the recombinant DNA construct is useful for improving plants with the recombinant plant growth respond cold, hear or drought tolerance, tolerance to herbicides, extreme commonic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the properties in trogen or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by production, improved lignin production or improved galactomannan condition, improved lignin production or improved data for this patent did not form part of the printed specification but was obtained in electronic form part of the printed specific promoter positioned to provide New recombinant DNA construct comprising a promoter positioned to provice for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties. cold tolerance, heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide. ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibacterial; vaccine; antisense therapy; Staphylococcus epidermidis; recombinant expression vector; infection; computer readable medium; computer based system.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an isolated polymucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. Alloiococcus otitidis is a Gram-positive bacterium. Also described: (I) an isolated polypeptide that is encoded by the polymucleotide (I), its expression vector comprising the novel isolated polymucleotide (I), its complement, despendent variant or fragment; (3) a genetically engineered host cell, transfected, transformed or infected with the vector of (2); (4) an antibody specific for the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide, its complement, biological equivalent or fragment, or the polypeptide (I); (5) an immunogenic composition comprising the polypeptides of (I) and a carrier; (I) a protein chip comprising in the expression vector; (6) a pharmacoutical composition composition; (9) detecting and/or identifying Alloiococcus of the polypeptides of (I), their biological equivalent or fragment; (8) immunogenic composition; (9) detecting and/or identifying Alloiococcus otitidis in the biological sample; (I0) a kit comprising a container; or the antibody of (4); and (11) producing a polypeptide by culturing the containing the novel polymucleotides, its degenerate variant or fragment; or the antibody of (4); and (11) producing a polypeptide by culturing the polypeptides, polypeptides, its degenerate variant or fragment; or the antibody of (4); and (11) producing a polypeptide by culturing the polymucleotides, polypeptides, its degenerate variant or fragment. Contraining the novel polymucleotides, its degenerate variant or fragment. Contraining the pulpage in the culture. (I) can be used in gene therapy. The polymucleotides are useful for expressing and detecting Alloiococcus otitidis. The present sequence represents an Alloiococcus otitidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                 The invention describes an isolated mucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and encoding an Staphylococcus epidermidis polypeptide with any of 3772 fully defined amino acid sequences (SEQ ID NO: 3772-7544) as given in the specification. Also described are: a recombinant expression vector; a cell comprising a recombinant expression vector of (1); producing an S. epidermidis polypeptide; an isolated nucleic acid a comprising a nucleotide sequence of at least 8 nucleotides in length; a vaccine composition for prevention or treatment of an S. epidermidis infection, comprising a nucleic acid cited above and a carrier; treating a subject for S. epidermidis infection; a recombinant or substantially pure preparation of an S. epidermidis polypeptide or its fragment; a vaccine composition for prevention or treatment of an S. epidermidis infection; detecting the presence of a Staphylococcus sucleic acid in a sample; a computer readable medium having recorded in it the nucleotide sequences with SQD ID NO: 1-3772 or its fragments; a computer based system for identifying fragments of the Staphylococcus genome and/or plasmids of commercial importance; a computer based system for identifying commercial importance; a computer based system for identifying commercial important nucleic acid fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment commercially important in ucleic acid fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment compositions of the present invention are useful for the diagnosis, prevention and/or treatment of an Staphylococcus epidermidis bacterial infection. This is the amino acid sequence of a S. epidermidis protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                   New isolated polypeptide and encoding nucleic acid derived from Staphylococcus epidermidis, useful for diagnosing, preventing and/or treating an S. epidermidis bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an isolated polymucleotide (I) of
Alloiococcus otitidis genomic DNA, which encodes an antigenic protein.
Alloiococcus otitidis ganomic DNA, which encodes an antigenic protein.
Alloiococcus otitidis is a Gram-positive bacterium. Also described: (I)
an isolated polypeptide that is encoded by the polymucleotide (I); (2) an expression vector comprising the novel isolated polymucleotide (I); (2) an expression vector of (I); (3) a genetically engineered host cell, transfected, transformed or infected with the vector of (2); (4) an antibody specific for the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide of (I) and a carrier; (7) a protein chip comprising the expression vector; (6) a pharmaceulical composition comprising the carrier; (7) a protein chip comprising the cypression vector; (6) a detecting and/or identifying an array of the polypeptide of (I); their biological equivalent or fragment; (8) immunogenic composition; (9) detecting and/or identifying Alloiococcus otitidis in the biological sample; (I0) a kit comprising a container containing the novel polynucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the polypeptide from the culture. (I) can be used in gene therapy. The polymucleotides, polypeptides, antibodies and compositions of the present invention can be used for treating and diagnosing diseases, drug creening assays and monitoring of effects during drug clinical trials.

The polymucleotides are useful for expressing and detecting Alloiococcus otitidis The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                             New DNA encoding amino-peptidase from Haemonchus contortus and derived peptide(s) - useful in protective vaccines, for new vectors, transformed cells and oligosaccharide, for incorporation in virus or microbe.
                                                                                                                                                                                                      The sequences given in AAR51280-82 represent varients of the helminth aminopeptidase H110D encoed by the genes H11-3, -2 and -1 respectively. H110D is a protein doublet which shows homolgy to a family of integral membrane aminopeptidases. The differences between the coding sequences and the translated products, can be attributed to different mRNAs of the multigene family, and also to different variants of the H110D-encoding sequence being present at different stages of the life cycle, or in strains differing in geographical origin. Antigenic fragments of these aminopeptidases may be used in vaccines to stimulate immune response against helminth parasites in humans or other animals. The DNA sequences encoding these proteins may be incorporated into a virus or microbe and used in a similar manner. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present sequence represents the human 67084FL protein, which is a member of the transporter family. The transporter family proteins (1) of the present invention have anorectic, antidabetic, anti-Parkinsonian, contropic, neuroprotective, hypotensive, antidabetic, anti-Parkinsonian, contropic, neuroprotective, hypotensive, antidabetics and can be used in gene therapy. The human transporter proteins from the present invention are cardiovascular and immunosuppressive activities, and can be used in gene therapy. The human transporter proteins from the present invention are casing assays. The polynucleotides encoding (1) can be used in screening assays (e.g. chromosome mapping, tissue typing, or in forensic biology), crossing clinical trials, or pharmacogenetics), as surrogate markers, controling clinical trials, or pharmacogenetics), as surrogate markers, and in methods of treatment (e.g. therapeutic or prophylactic). (1) are useful for treating disorders characterised by insufficient or excessive crossin of $6708, $67102, $44181, $7363, $67046, $67102, $44181, $7363, $67046, $67102, $44181, $7084FL or $67084alt substrates or production of transport 8099, $46455, $54414, $3763, $67076, $67102, $44181, $7084FL or $67084alt inhibitors. Disorders associated with supar homeostasis cuch as obesity, diabetes or anorexia. Disorders associated with supar homeostasis contensis, $67076, $67102, $44181, $67084FL or $67084alt are e.g. CNS disorders (e.g. Parkinson's disease or Alzheimer's disease, autonomic function disorders (e.g. hypertension injury or earticoparacters (e.g. hypertension arge-related disorders), or immune disorders (e.g. hypothyroidism or hyperthyroidism), crestenosis), hormonal disorders (e.g. hypothyroidism or hyperthyroidism), con immune disorders (e.g. hypothyroidism or hyperthyroidism), con immune disorders (e.g. chromic muccoutaneous candidiasis)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

transporter family. The transporter family proteins are members of the present invention have anorectic, antidiabetic, anti-Parkinsonian, nootropic, invention have anorectic, antidiabetic, anti-Parkinsonian, nootropic, and undention be used in gene therapy. The human transporter proteins from the present invention are designated thuman transporter proteins from the present invention are designated thuman transporter proteins from the present invention are designated to polynucleotides encoding (1) can be used in screening assays (e.g. chromosome mapping, tissue typing, or in forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical trials, or pharmacogenetics), as surrogate markers, and in methods of treatment (e.g. therappeutic or prophylactic). (1) are useful for treating disorders characterised by insufficient or excessive production of 8099, 46455, 54414, 53763, 67076, 67120, 44181, 67084FD or 67084FL or 67084FL inhibitors Disorders associated with 8099 and obesity, diabetes or anprexia Disorders associated with 5414, 53763, 67076, 67102, 44181, 67084FL or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (e.g. hypertension, depression or schizophrenia), or learning or memory disorders (e.g. amnesia or age-related disorders), cardiovascular disorders (e.g. ischaemia reperfusion injury or restenosis), hormonal disorders (e.g. hypothyroidism or hyperthyroidism), or immune disorders (e.g. chronic mucocutaneous candidiasis). The present sequence represents a human transporter protein related protein from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                          New 67076, 67102, 44181, 67084FL and 67084alt nucleic acids and proteins, useful in e.g. treating disorders characterized by insufficient or excessive production of the polypeptides, e.g. cardiovascular or immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present invention describes human proteins which are members of the

```
The invention relates to an isolated nucleic acid comprising a CDNA is for a human transporter protein, or its complement, a sequence that is 60 % identical to the CDNA, a fragment comprising at least 30 nucleotides of the CDNA, or a sequence encoding a fragment of the polypeptide comprising at least 10 contiguous amino acid residues of the CDNA, Also included are a vector comprising the novel nucleic acid molecule, producing the polypeptide, the isolated transporter polypeptide, an isolated antibody that specifically binds to the polypeptide, detecting the presence of the polypeptide or nucleic acid in a sample, a kit, identifying a compound that binds to, or that modulates the activity of, the polypeptide, and modulating the activity of, the polypeptide, and modulating the activity of the polypeptide. The polypeptide or nucleic acid is useful for preparing a composition for treating PGC-1 (not defined) associated disorders e.g. liver tumours, benesity, epilepsy or diabetes. The present sequence represents a novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid, useful for preparing a composition for treating PGC-1 associated disorders e.g. liver tumors, obesity, epilepsy or diabetes.

IC47615, HNWDA-1, TWIK-9, alpha-2delta-4, 54414 and 53763 ion channel

Emily (ICF) nucleic acids and proteins. The TWIK-7, IC23927,

TWIK-8, IC47611, IC47615, HNMDA-1, TWIK-9, alpha-2delta-4, 54414 and

Emily (ICF) nucleic acids and proteins may be used for preventing,

CHARLES ICF nucleic acids and proteins may be used for preventing,

CHARLES ICF nucleic acids and proteins may be used for preventing,

CHARLES ICF nucleic associated with decreased expression by rectifying

THE ADDITION OF ADDITION OF THE PROTEINS OF THE SEQUENCES MAY BE USED

CHARLES OWN PRODUCTION OF ICF Proteins or to supplement the patients own production of ICF proteins or to supplement the used as antigens in the production of antibodies against ICF proteins and in assays to identify modulators of ICF protein expression and activity. The antigens in the production of antibodies against ICF proteins may also be anti-ICF protein architecting the presence of ICF proteins in seed as diagnostic agents for detecting the presence of ICF proteins in samples (e.g. by immunoassay). The nucleic acids and proteins may be used to prevent, diagnose and treat a wide variety of disorders, e.g. cancers and leukaemia, Alzheimer's disease, Parkinson's disorders, multiple sclerosis, epilepsy, hepatic disorders and cardiovascular disorders. This interior relates to novel numan transporters and ion channel convention may be useful for the production of compounds with a convention may be useful for the production of compounds with a convention may be useful for the production of compounds with a convention may be useful for the production of compounds with a convention; antiallergic, cerebroprotective, gastrointestinal, hepatotropic, anticonvulsant, antibarchinal, hepatotropic, anticonvulsant, antiparkinsonian, antibacterial, antiparastic, cardiant, cardiavascular, antihacterial, cardiant, cardiavascular, antihacterial, antibacterial, antibacterial, antibacterial, antiparastic, cardiant, cardiavascular, antihacterial, noctropic activity acting as TRICH agonists or antagonists. In addition the disclosed acting as TRICH agonists or antagonists. In addition the disclosed admormal expression or activity of TRICH, such as neurodegenerative diagnosing, preventing, and treating disorders associated with an abnormal expression or activity of TRICH, such as neurodegenerative disorders (for example myotonic dystrophy, catatonia), endocrine disorders (for example myotonic dystrophy, catatonia), endocrine disorders (for example myotonic dystrophy, catatonia), endocrine cample scleroderma, systemic lupus erythematosus, allergies), cardial, fungal, parastic, protozoal, infections (for example viral, bacterial, fungal, parastic, protozoal, helminthic), cardiavascular disorders (for example dodpasture's syndrome), infections (for example viral, bacterial, fungal, parastic, protozoal, helminthic, cardiavascular disorders (for example atherosclerosis), or hepatic diseases (for example compounds that specifically bind to and modulate the activity of TRICH. The nucleotides can be used to create humanised animals or transgenic animals to model human disease. The present sequence is that of a human converse converse or the present sequence is that of a human converse conver

The present sequence represents the fundable of anti-protein (1) of the present invention have anorectic, antidiabetic, anti-Parkinsonian, cootropic, neuroprotective, hypotensive, antidepressant, neuroleptic, cardiovascular and immunosuppressive, antidepressant, neuroleptic, cardiovascular and immunosuppressive, antidepressant, neuroleptic, cardiovascular and immunosuppressive activities, and can be used in gene therapy. The human transporter proteins from the present invention are designated 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL and 67084alt. The polynucleotides encoding (1) can be used in screening assays (e.g. chromosome mapping, tissue typing, or in forensic biology), cassays (e.g. chromosome mapping, tissue typing, or in forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, conditional trials, or pharmacogenetics), as surrogate markers, and in methods of treatment (e.g. therapeutic or prophylactic). (I) are useful for treating disorders characterised by insufficient or excessive production of 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL or 67084alt substrates or production of transport 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL or 67084alt inhibitors. Disorders associated with sugar homeostasis cuch as obesity, diabetes or anorexia, Disorders associated with 54414, 67084FL or 67084alt are e.g. CNS disorders (e.g. phypertension, depression or schizophrenia), or learning or memory disorders (e.g. hypertension, depression or schizophrenia), or learning or cardiovascular disorders (e.g. hypertension, depression or schizophrenia), or learning or cardiovascular disorders (e.g. hypertension, characterial repertension, hymanal disorders (e.g. hypertension, hymanal signates), and hypertension, hymanal signates or production or schizophrenial, hymanal disorders (e.g. hypertension, hymanal disorders (e.g. hypertension), hymanal disorders (e.g. hypertension), hymanal disorders (e.g. hypertension), hymanal disorders (e.g. hypertension), hymanal diso
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; transporter protein; anorectic; antidiabetic; anti-Parkinsonian; nootropic; neuroprotective; hypotensive; antidepressant; neuroleptic; cardiovascular; immunosupressive; gene therapy; sugar homeostasis; obesity; diabetes; anorexia; central nervous system disorder; depression; CNS disorder; Parkinson's disease; Alzheimer's disease; hypertension; autonomic function disorder; schizophrenia; learning disorder; amnesia; memory disorder; age-related disorder; ardiovascular disorder; ischaemia reperfusion injury; restenosis; hormonal disorder; hypothyroidism; hyperthyroidism; immune disorder;
                                                                                                                                                                                           New 67076, 67102, 44181, 67084FL and 67084alt nucleic acids and proteins, useful in e.g. treating disorders characterized by insufficient or excessive production of the polypeptides, e.g. cardiovascular or immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             restenosis), hormonal disorders (e.g. hypothyroidism or hyperthyroidism), or immune disorders (e.g. chronic mucocutaneous candidiasis)
                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents the human 67084alt protein, which is a

```
The present invention describes human proteins which are members of the transporter family. The transporter family proteins (I) of the present invention have anorectic, antidiabetic, anti-Parkinsonian, nootropic, neuroprotective, hypotensive, antidepressant, neuroleptic, cardiovascular and immunosuppressive activities, and can be used in gene therapy. The human transporter proteins from the present invention are designated 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL and 67084aut. The polymucleotides encoding (I) can be used in screening assays (e.g. chromosome mapping, tissue typing, or in forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical trails, or pharmacogenetics), as surrogate markers, and in methods of transpentic or prophylactic). (I) are useful for treating disorders characterised by insufficient or excessive production of 8099, 67102, 44181, 67084FL or 67084alt inhibitors. Disorders associated with 8099 and 44181, 67084FL or 67084alt inhibitors. Disorders associated with 8099 and 44181, 67084FL or 67084alt inhibitors. Disorders associated with 8099 and 46185, 511clude disorders associated with sugar production of anorexists of a such as a sociated with 8099 and 46181, 67084FL or 67084alt inhibitors. Disorders associated with 8099 and 67084FL or 67084alt inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       obesity, diabetes or anorexia. Disorders associated with 54414, 53763, 67102, 44181, 67084FL or 67084alt are e.g. CNS disorders (e.g. Parkinson's disease or Alzheimer's disease), autonomic function disorders (e.g. hypertension, depression or schizophrenia), or learning or memory disorders (e.g. amnesia or age-related disorders), cardiovascular disorders (e.g. ischaemia reperfusion injury or restenosis), hormonal disorders (e.g. hypothyroidism or hyperthyroidism), or immune disorders (e.g. chronic mucocutaaneous candidiaasis). The present sequence represents a protein given in comparison with a human transporter protein from the
                                                                                                                                                                                                                                                                                                                                    New 67076, 67102, 44181, 67084FL and 67084alt nucleic acids and proteins, useful in e.g. treating disorders characterized by insufficient or excessive production of the polypeptides, e.g. cardiovascular or immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 82.8%; Score 24; DB 5; Length 1095; 71.4%; Pred. The invention relates to an isolated nucleic acid comprising a cDNA encoding a human transporter protein, or its complement, a sequence that is 60 % identical to the cDNA, a fragment comprising at least 30 nucleotides of the cDNA, as sequence encoding a fragment of the polypeptide comprising at least 10 contiguous amino acid residues of the cDNA. Also included are a vector comprising the novel nucleic acid molecule, producing the polypeptide, the isolated transporter polypeptide, an isolated antibody that specifically binds to the polypeptide, an isolated antibody that specifically binds to the polypeptide, a kit, identifying a compound that binds to, or that modulates the activity of, the polypeptide, and modulating the activity of the polypeptide. The nucleic acid is useful for preparing a composition for treating PGC-1 (not defined) associated disorders e.g. liver tumours, obesity, epilepsy or diabetes. The present sequence represents a species homologue of a novel human transporter protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, transporter; cytostatic; anorectic; antidiabetic; anticonvulsant;

  proteins are useful for preparing compositions for diagnosing or treating diseases or conditions associated with decreased expression or overexpression of functional TRICH e.g. atherosclerosis or cancer. The invention is useful in gene therapy. The present sequence is human TRICH
                                                                                                                                                                                                                                                                                                                                                                                 Transporter; cytostatic; anorectic; antidiabetic; anticonvulsant; gene therapy; PGC-1 associated disorder; liver tumour; obesity; epilepsy; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid, useful for preparing a composition for treating PGC-1 associated disorders e.g. liver tumors, obesity, epilepsy or diabetes.

                                                                                                                                          encoding a human transporter procein, or its complement, a sequence that its 60 % identical to the cDNA, a fragment comprising at least 30 nucleotides of the cDNA, or a sequence encoding a fragment of the polypeptide comprising at least 10 contiguous amino acid residues of the cDNA. Also included are a vector comprising the novel nucleic acid molecule, producing the polypeptide, the isolated transporter polypeptide, an isolated are persence of the polypeptide or nucleic acid in a sample, a kit, identifying a compound that binds to the polypeptide, a kit, identifying a compound that binds to or that modulates the activity of, the polypeptide, and modulating the activity of the polypeptide, and modulating the activity of the polypeptide, and modulating the activity of the reacting poct-1 for defined associated disorders e.g. liver tumours, obesity, epilepsy or diabetes. The present sequence represents a novel human transporter protein.
                                                         New isolated nucleic acid, useful for preparing a composition for treating PGC-1 associated disorders e.g. liver tumors, obesity, epilepsy or diabetes.

The invention relates to TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611,

CC IC47615, HNMDA-1, TWIK-9, alpha-2delta-4, 54414 and 53763 ion channel

CC IC47615, HNMDA-1, TWIK-9, alpha-2delta-4, 54414 and 53763 ion channel

CC Edmily (ICF) mucleic acids and proteins may be used for preventing.

CT WIK-8, IC47611, IC47615, HNWDA-1, TWIK-9, alpha-2delta-4, 54414 and

CC 53763 ICF nucleic acids and proteins may be used for preventing.

CC diagnosing and treating ICF-related diseases. The sequences may be used

CC diagnosing and treating ICF-related diseases. The sequence may be used

CC diagnosing and treating ICF-related with decreased expression by rectifying

CC diagnosing and protein's genome that affect the activity of

CC patients own production of ICF proteins and in

CC patients own production of antibodies against ICF proteins and in

CC anti-ICF protein antibodies, agonists and antaponists may be used to

CC regulate ICF protein antibodies, agonists and activity. The antibodies may also be

CC samples (e.g. by immunosasay) The nucleic acids and proteins may be used

CC samples (e.g. by immunosasay). The nucleic acids and proteins may be used

CC samples (e.g. by immunosasay). The nucleic acids and proteins may be used

CC samples (e.g. by immunosasay). The nucleic acids and proteins may be used

CC samples (e.g. by immunosasay) and evariately of disorders, e.g. cancers

CC and leukaemia, Alzheimer's disease, Parkinson's disease, multiple

CC sclerosas, ephlepsy, hepatic disorders and cardiovascular disorders. This

CC sclerosas, ephlepsy, hepatic disorders and cardiovascular disorders. This

CC sclerosas acident for this patent is also available in electronic format

CC from USPTO at segdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611, IC47615, HNMDA-1, TWIK-9, alpha2delta-4, 54414, or 53763 nucleic acids and proteins, useful for preventing, diagnosing and treating e.g. cancers, Alzheimer's disease and cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mouse; ion channel family; ICF; cancer; leukaemia; Alzheimer's disease; Parkinson's disease; multiple sclerosis; epilepsy; hepatic disorder; cardiovascular disorder; cytostatic; neuroprotective; nootropic; antiparkinsonian; hepatotropic; cardiovascular.

[27] assays to identify modulators of ICF proteins may be used
[28] cancel semples (e.g. by immunosasay). The nucleic acids and proteins may be used
[28] concers and leukaemia, Alzheimer's disease, Parkinson's disease, multiple
[28] colerosis, epilepsy, hepatic disorders and cardiovascular disorders. This
[28] sequence represents a murine protein used in the scope of the invention.
[28] Note: The sequence data for this patent is also available in electronic
[28] format from USPTO at seqdata.uspto.gov/sequence.ttml.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611, IC47615, HNMDA-1, TWIK-9, appha2delta-4, 54414, or 53763 nucleic acids and proteins, useful for preventing, diagnosing and treating e.g. cancers, Alzheimer's disease and cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      82.8%; Score 24; DB 8; Length 1095; 71.4%; Pred. The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for
preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense; prokaryotic essential gene; cell proliferation; drug design.

The present sequence represents a Staphylococcus aureus protein, that, based on homology with a Bacillus subtilis protein, is believed to be a probable UDP-N-acetylglucosamine 1-carboxyvinyltransferase (enoylpyruvate transferase, UDP-N-acetylglucosamine enoylpyruvyl transferase). The DNA sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of staphylococcal genes. The DNA sequence to control the expression of staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host apainst invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome
                                                                 Staphylococcus aureus protein; ribozyme; antisense sequence; control; Staphylococcal gene; regulatory element; bacterial gene expression; vaccine; Staphylococcal infection; food poisoning; scaled skin syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel polypeptide(s) from Staphylococcus aureus strain WCUH29 - us
isolate antimicrobial compounds, and in vaccines against S. aureus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the invention relates to an increase acts completely any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(i) a vector comprising a promoter operably linked to the nucleic acid encoding a promoter operably linked to the nucleic acid encoding a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway confideration or that has an activity against a biological pathway or that has an activity against a biological pathway or the proliferation or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the extent compound activity; (11) a culture compound that inhibits the extent to which each of the strains is present in a culture or collection of proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for collular proliferation to solate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      invention relates to an isolated nucleic acid comprising any one of

This represents a receptor protein tyrosine kinase (PTK) subtype tyro-9.

The invention provides sequences AAV65308 to AAV65313, AAV65315, and
AAV65317 to AAV65319 that encode proteins having a tyrosine kinase domain
and a tissue expression pattern of a receptor PTK subtype selected from
and a tissue expression pattern of a receptor PTK subtype selected from
tyro-1, tyro-2, tyro-3, tyro-4, tyro-5, tyro-6, tyro-8, tyro-10, tyro-11,
and tyro-12, respectively. The polymaclecides are useful for the
certion of tyrosine kinase domain sequences and detection of tissue
certion patterns of PTK subtypes. The CDNAs can also be injected into
cocytes, the protein expressed, and expression products screened for
using antibodies against tyrosine kinase epitopes. These subtypes
cocytes, the protein expressed, and expression products screened for
using antibodies against tyrosine kinase epitopes. These
certion protocols are used in the diagnosis of diseases associated with
(receptor) PTKS. Recombinant vectors expressing the subtypes can be used
to treat related diseases e.g. tumours, by introduction of the vectors
into skin transplants, then grafting these into the connective tissue of
the dermis, thus specifically targetting tumours as the proteins are
certion the matrix
